Autumn Term- Years 5 and 6

London Zoo animal research activity

We continued the work we have been comparing animal's life cycles by completing a research task, creating a presentation all about chosen animal we saw at the zoo (including their life cycle, diet, habitat, characteristics, interesting facts and a glossary for key vocabulary).

Life Cycle Of a humboldt penguin

- A penguin is a bird, which means it only eats meat (carnivore).
- It's offspring are born as eggs, before becoming a chick developing into an independent adult penguin.
- The Humboldt penguin also reproduces sexually.

Size and characteristics Of a humboldt penguin

- A medium-sized humboldt grows to be about 26-28 inches long and weighs about 10.4 pounds!
- They have black feathers on the back and white feathers on the front with a distinctive U-shaped black band across the front.

Glossary

- Carnivore** - An animal that feeds on meat and does not eat plants.
- Offspring** - Another word for child.
- Resides** - An animal/human that is living somewhere permanently in a particular place.
- Reproduces** - (of an organism) produce offspring by a sexual or asexual process.
